Hints:

Selection of bright/dark switching mode is standard. The selection switch can be reached after removing the blanking screw designated 'PG1'. Bright switching means that the output (here the pnp transistor) is operated when the transmitter light is received by the receiver after being reflected by the reflector. The switch indicator LED (green) for the working contact always lights when the output is energised.

The on- (Ti) and off- (Ta) delay are optional. Turning the controls behind 'PG2' clockwise increases delay times. The delay time range is between approx. 0 and 10 secs. Other delays are available on request. 1sec, 3secs and 10secs.

The level indicator 'DIANA' (Digital ANALog indicator) is optional, too. DIANA shows the level approx. 20 to 25 times above the threshold signal. For proper operation of the light barrier it is not necessary to have all DIANA LEDs on!
